EBNA 1 protein is used to stably maintain episomes containing EBV Origin of replication (oriP) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

The present sequence is an anti-sense strand of commercially available plasmid pCMVEBNA from which Epstein Barr Virus Nuclear Antigen 1 (EBNA 1) encoding DNA is obtained. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orib) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy,
                                                                                                                                                       Anti-sense strand; plasmid pCMVEBNA; EBNA 1; episome; transfection; Epstein Barr Virus Nuclear Antigen 1; origin of replication; EBN oriP; eucaryotic host cell; recombinant cell line; ion channel; multiple gene expression; receptor; transporter protein; gene therapy; transcription factor; adhesion molecule; antisense therapy; gene amplification; cell immortalisation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         method for expressing genes from recombinant eukaryotic cells,

                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2387 ccagggagctggcaggcggcctggaggatggggagcctcagcagaagcgggcccacaca

The cell is used to assay a test compound for its effect on a G_iPCR. The method and cells are useful for assaying agonist and antagonist compounds, which bind to G_iPCR which, stimulate intracellular calcium mobilization, such as the nociceptin receptor, and particularly chemokine receptors such as CCR3, CCR2 and the interleukin 8 receptor type B. The present sequence represents the nucleotide sequence of the PCEP4 vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            enhance signal transduction responses involving cytoplasmic

                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acid (see also V21684-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene therapy of many diseases.

The vector is preferred for use in novel compositions and methods for improved polynucleotide delivery into cells. In these methods, polycationic agents are used to increase the frequency of uptake of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This polynucleotide comprises the DNA sequence of vector plasmid pCMVKmTR-EPI, which contains an Epstein-Barr virus (EBV) origin of replication from plasmid pCEP4, a coding region for EBV nuclear annigen A from pCEP4, a pair of inverted terminal repeats from adeno-associated virus, a cytomegalovirus enhancer/promoter, a bovine growth hormone polyA sequence, and a kanamycin resistance selectable marker. Polynucleotides encoding polypeptides, such as erythropoietin or leptin, and ribozymes and antisense polynucleotides can be inserted into the vector. The vector is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polycationic agents based on alpha-amino acids, able to complex with nucleic acid - to facilitate its entry into cell, condense it and protect it against serum degradation, particularly for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   *tag= e

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Plasmid pcisEBON (a pRK5 derivative) is an episomal CMV driven expression plasmid. HuHGF variants with enhanced receptor binding activity were produced by site-directed mutagenesis. Stable populations of preferred HGF variants were obtained by transfecting human embryonic kidney 293 cells and then these were subcloned in pcisEBON. See R52940-R52949 for examples of pref. HGF variants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2387 ccagggagctggcaggcctggaggatgggagcctcagcagaagcgggcccacacag

Nucleotide sequence of plasmid pCIS.EBON

(first entry)

10-MAY-1999

```
This sequence represents the episomal CWV driven expression plasmid possible was used in the expression of variant human hepatocyte growth factor (HGF). HGF is isolated from human serum and is a disulphide linked heterodimer derived by proteolytic cleavage of the pro-hormone between residues 494 and 495. This generates a molecule composed of an alpha subunit of 440 amino acids (mol. Wt. 69 kD) and a beta subunit of 234 amino acids (mol. Wt. 34 kD). The alpha and beta subunits are encoded by a single open reading frame. The alpha subunit contains four kringle domains based on their homology to kringle-like domains in other proteins, e.g. prothrombin, plasminogen. The beta subunit shows high homology to the catalytic domain of serine proteases. However two of the three residues which form the catalytic triad of serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          variants which retain HGF receptor binding activity without having the biological activity of wild-type HGF. They can be used for the treatment of pathological conditions associated with the activation of a HGF receptor such as malignancies associated with chronic HGF receptor activation. The pCiseBBON plasmid comprising the HGF coding sequence may be used for manipulation of the HGF coding sequence and expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New hepatocyte growth factor variants - are resistant to in vivo proteolytic cleavage into a 2-chain form, useful as HGF antagonists

The present sequence represents the nucleotide sequence of pCIS.EBON, which is used in the course of the invention. The specification describes a hepatocyte growth factor (HGF) variant (HGFV) comprising an amount oacid (aa) alteration at or adjacent to position 692 of the denotion and the course of the function of the function of the functionally important domains in the aa sequence. It may also be used to identify an residues which are responsible for the interaction of HGF with its receptor, and those aa that are responsible for the interaction of HGF with its receptor, and those aa that are responsible for the interaction of hidding affinity (compared to wild-type huHGF) and are more biologically active than wild type huHGF, may be used as huHGF agonists. Conversely, variants of HGFV which have enhanced receptor binding affinity (compared to wild-type huHGF) but which are biologically inactive may be used as conditions associated with the activation of an HGF receptor, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    malignancies associated with chronic HGF receptor activation. HGFv-immunoglobulin chimeras may be produced (by standard methods) and used in protein A purification, immunohistochemistry, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoprecipitation techniques (in place of anti-HGF antibodies) or in screening studies to identify inhibitors of HGF-HGF interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New hepatocyte growth factor variants - useful for studying structure-function relationships in the wild type molecule and for treating conditions associated with chronic hepatocyte growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10596 BP; 2627 A; 2571 C; 3023 G; 2375 T; 0 other;

This DNA encodes a stabilising polypeptide and is the FLGA insert of the invention. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of cormula [(Glya)X(Glyb)X(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 formula [(Glya)X(Glyb)X(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 cormula [(Glya)X(Glyb)X(Glyc)Z]n where Glya, X Y and Z need not cormula from northing a nucleic acid encoding a core protein. The fusion proteins of the cormula and complex half-life than the unfused core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the corre protein may be an IkappaB regulator protein for the particular, the cormula globases, cancer and inflammation. In which can activate nitro drugs in enzyme/produg therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging.
                                                                                                                                                                                                       Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; lkappab regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats
                                                                                                                                                                                                                                                                                                                                                                                                                      /*tag= a

Polynucleotides X3555-62 encode secreted proteins (Y02281-87). The polynucleotides are obtained from human fetal kidney, human adult muscle, human placenta, murine adult bone marrow, human adult spinal cord and human adult lymph node cDNA libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haematopolesis regulating activity, tissue growth activity, activithinhalm activity, chemotactic/chemoxinetic activity, haemostatic and thrombolytic activity, remonately activity, and tiniamatory activity, cadherin/tumor invasion suppressor activity, and tumor
cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibition activity. The polynucleotides are also stated to be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human polynucleotides encoding secreted proteins useful for gene

The sequence is used for producing a natural avermectin by fermenting S. avermitilis in which the copy number of the bkdF (097702), bkdG (see 097710) or bkdH (097712) genes has been increased or their expression has been enhanced by manipulation or replacement of the genes responsible for regulating such expression. The sequence is also used for producing a novel (non-natural) avermectin, by fermenting S. avermitilis in which expression of the bkdF, bkdG or bkdH genes has been decreased or eliminated by deletion, inactivation or replacement of the genes
                                                                                                   Streptomyces branched chain alpha-keto:acid dehydrogenase complex DNA - also host cells containing the DNA, useful for prodn. of natural and novel avermectin(s) by fermentation.

The specification describes the production of modified phytase with improved properties. This comprises modelling the three-dimensional structure of the phytase being modified, and optionally that of another phytase with better activity, on the basis of the 3D-structure of A. niger phytase,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vogel K,
```

```
identifying amino acid residues in the active site that differ between the phytases, constructing a phytase encoding DNA by changing at least one of the differing amino acids in the active site, and then expressing the DNA construct in a host cell. Phytases are useful as feed additives for converting phytase to myo-inositol and inorganic phosphate. Addition of modified phytase to feed reduces the amount of phytate in animal manure.
                                                                                                                                                                                                                                      Sequence 1567 BP; 295 A; 526 C; 445 G; 301 T; 0 other;

Sequence 3, Application US/08470892
Patent No. 5707839
GENERAL INFORMATION:
APPLICANT: DENOYA, CLAUDIO D.
APPLICANT: STUTZMAN-ENGWALL, KIM J.
TITLE OF INVENTION: ALPHA-KETOACID DEHYDROGENASE COMPLEX FROM STREPTOMYCES
TITLE OF INVENTION: AVERMITILIS
NUMBER OF SEQUENCES: 14
CORRESPONDENCE ADDRESS:
ADDRESSEE: DR. PETER C. RICHARDSON, PFIZER INC
STREET: 235 BAST 42ND STREET, 20TH FLOOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2387 ccagggagctggcaggcggcctggaggatggggagcctcagcagaagcgggcccacacag 2446

/lab_host="bH10B (phage-resistant)"
/note="Organ: overy: Vector: pOTB); Site_1: XhoI; Site_2:
EcoRI; cDNA made by oligo-dT priming. Directionally
cloned into EcoRI/XhoI sites using the following 5'
adaptor: GGCACGAG(G). Size-selected >500bp for average
insert size 1.8kb. Library constructed by Ling Hong in
the laboratory of Gerald M. Rubin (University of
California, Berkeley) using ZAP-cDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies)."
Tissue Procurement: DCTD/DTP

CDNA Library Preparation: Ling Hong/Rubin Laboratory

CDNA Library Preparation: Ling Hong/Rubin Laboratory

CDNA Library Arrayed by: The Ling.A.G.E. Consortium (LLNL)

DNA Sequencing by: Incyte Genomics, Inc.

Clone distribution: MGC clone distribution information can be
found through the I.W.A.G.E. Consortium/LLNL at: image.llnl.gov

Plate: LLCM322 row: o column: 06

High quality sequence stop: 726.

Notice Submitted (28-APR-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA On Aug 2, 1999 this sequence version replaced gi:562994.

On Aug 2, 1999 this sequence version replaced gi:562944.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgpéfruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft, sequence record is consists of 94 contigs. The true order of the pieces is not known and their order in this sequence record is a runs of 94 contigs. The true contents are represented as runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                2" (bases I to 125448)

Strickland, C., Subramanian, A., Torruella-Miller, I., Vassiliev, H., Vo.A., Wagner, A., Wang, B., Wheeler, J., Wu, Y., Ye, W.J., Zhao, J. and
                                                                    Direct Submission
Submitted (23-JUL-1998) Whitehead Institute/MIT Center for Genome
Research, 320 Charles Street, Cambridge, MA 02141, USA
On Jul 23, 1998 this sequence version replaced gi:335015.
All repeats were identified using RepeatMasker: Smit, A.F.A. &
Green, P. (1996-1997)
                                                                                                                                                                                                                                                                            Only the first 118.8 kilobases of this clone are being submitted The remainder overlaps accession number AC005274 (WICGR project
                                                                                                                                                                                                                             http://ftp.genome.washington.edu/RM/RepeatMasker.html
